AUTHOR: Krzycki, Z.

TITLE: An arrangement for measuring the ferrite resonant line in a waveguide with diaphragm

PERIODICAL: Archiwum elektrotechniki, v. 10, no. 2, 1961,
601-605

TEXT: The author describes a very simple method of measuring the resonant line width of ferrites. The measuring arrangement consists of typical elements having no special requirements. It consists of a generator, accurate alternator, a section of a waveguide with diaphragm and of a detection circuit. A short justification of the method is given first. The author considers the coupling between two waveguides joined together by means of a diaphragm common to both; the diaphragm has at its center a small circular aperture which is filled with ferrite. The ferrite is magnetized by a constant magnetic field along the x-axis. An analysis is then made in the MKSA system of units for the steady state and harmonic time

function of type $e^{-j\omega t}$. The symbolic notation is used throughout. The problem is solved in the same way as it has been done by D.C. Stinson for couplers (Ref. 5: Coupling through an aperture containing an anisotropic ferrite, IRE Trans., vol. MTI-5, July 1957 184-191). It may be seen that the coupling of two waveguides connected symmetrically is proportional to $|\tilde{\mu}|$ and that of waveguides twisted with respect to each other by 90° proportional $|\tilde{k}|$. From this, follows the possibility of measurement of ferrite lines. It is especially easy to measure the resonance line width ΔH , which is defined as the limits of variation of the constant magnetic field, at which either $|\tilde{k}|$ or $|\tilde{\mu}|$ have their values $\sqrt{2}$ times less than those at resonance. It is also easy to measure the spectroscopic coefficient of diffusion gef . This coefficient is determined from the known relationship $gef = \frac{f}{1.4H_r}$, where f is the measurement

frequency in mc/s and H_r the resonance value of the magnetic field intensity in oersteds. It can be shown that the form of

$$c_1 = c_0 + 20 \log |\tilde{k}|. \quad (11)$$

when it determines the coupling through a hole completely filled with ferrite does not change. Measurement is performed using the twisted system of waveguides, when coupling as a function of constant magnetic field follows the coefficient $|k|$. In the other system - the coupling does not follow $|k|$ because it is then resulting from coupling both through the ferrite and the non-filled-in portion of the hole. The results of measurement of ΔH in both systems will thus differ considerably. Only measurements with the twisted system are of value. The results are shown in tabulated form together with the results of measurements of coupling with diaphragm, the results of measurements are given as performed by the author on a hybrid coupler and with the results obtained using resonance methods as performed at the Heinrich Hertz Institut in Berlin and at the Institut fur Magnetische Werkstoffe in Jena. All samples were made of ferrites designed at IPPT-PAN. The measurements were performed using ball samples at a frequency 9300 Mc/s. The diaphragm had a thickness $t_0 = 1$ mm with a hole of $d = 3.7$ mm in diameter, placed in a waveguide with $a = 22.7$ mm, $b = 10.2$ mm. Under these conditions $C_0 = -44.1$ db. To make the influence of the

detector characteristic negligible, an attenuator attenuated the resonance power by 3 db in the detector which was the power level of ΔH measurement. It must be added that this method can be applied to polar measurements. For this purpose additional holes were drilled in the waveguide. The author acknowledges the help of Professor, Engineer A. Smoliński. There are 3 figures, 1 table and 6 references: 3 Soviet-bloc and 3 non-Soviet-bloc. The references to the English-language publications read as follows: H.A. AUTHOR: Krzycki, Z.

TITLE: Measurement of parametric diodes in the 10 cm frequency band

PERIODICAL: Archiwum elektrotechniki, v. 11, no. 1, 1962, 174-177

TEXT: The method of measurement of the diode junction resistance at its working frequencies in the microwave range and of diode capacitance is described, and fundamental relations between the diode parameters are presented. The resistance and capacitance of the diode junction are obtained from measurement of its impedance which is accomplished with a measuring head; at given frequency this head is combined with an ideal transformer of ratio N and reactance X, connected in series with the junction impedance Z_d as shown on Fig. 4.

Elements of this circuit are measured according to the procedure described and the resistance and capacity of the junction are calculated from the formulas. Results of the measurements of Ge diodes \sqrt{C} of the gold-bonded type made at the Institut elektroniki IPPT PAN

TITLE: Recent development in research on microwave ferrite components in Poland

SOURCE: Przeglad elektroniki, no. 8, 1965, 365-371

TOPIC TAGS: microwave component, ferrite, resonance line, ferromagnetic resonance, measurement, nonlinear effect

ABSTRACT: This paper concerns the development of microwave ferrite components in Poland since 1954. The research on nickel-copper-cobalt and nickel-copper-zinc ferrites with narrow resonance lines carried out by Dr. R. Wadas is mentioned, and the measurement of ferromagnetic resonance by the Zenon Krzycki method is described. The characteristics of 17 microwave ferrite components designed and manufactured in Poland are given. The assumption is made that future research in Poland will concentrate on developing millimeter band components in the microwave range, on improving the assortment of components, and on utilizing the nonlinear phenomena in ferrites. This paper was read at the Ninth Yugoslav Conference ETAN, held in Bled in Nov. 12-14, 1964.

V Chemical examination of *Crinum abyssinicum* seeds, oil, C 11
and seed cake. Jan Kryszynski. Roczniki Nauk Rolniczych Ser. A, 69, 341-6 (1984).—*C. abyssinicum* seed without
the seed coat had a higher fat content than either spring or
winter rape. The organoleptic properties of *C. abyssinica*-
seed oil were also better. The oil differed in chem. proper-
ties but slightly from rapeseed oil. The seed cake obtained
from hulled seeds contained up to 46% protein and was
suggested as a possible feed concentrate. The seed cake
contained a small amt. of mustard oils and could, therefore,
be fed without any limitations. Ernest G. Jaworski

4162. AN ATTEMPT TO CREATE AN EXPERIMENTAL 'MODEL OF CHILLING' -
Próba stworzenia doświadczalnego 'modelu przeziębienia' - Krzysztof H.
I Klin. Chor. Wewn., A. M., Poznań - POL. ARCH. MED. WEWNĘT. 1958, 28/11
(1441-1447) Illus. 4

The nature of the phenomenon of 'cold' or 'chilling' is not yet well understood; it is assumed to occur in the organism with a disorder of thermoregulation. 'Chilling' in man is usually the result of a relatively rapid cooling, preceded by a dilatation of the cutaneous vessels and a dehydration due to evaporation and sweating. To create similar conditions in rabbits, the animals were given pilocarpine (0.02 mg./kg. s.c.) and after a lapse of 30 min. they were transferred from an environment at 25°C. to a cold room at +4°C. The object of this was to induce dilatation of the blood vessels, especially in the skin, and dehydration. The experiments were performed during the summer. Five rabbits were subjected once each to pilocarpine and low-temperature treatment; 5 others underwent this experiment twice, with an interval of one week; 5 controls were kept for 3 hr. in the cold room only and 5 other controls received pilocarpine only. After 3 months all rabbits were killed and their kidneys examined histologically. In the rabbits subjected to pilocarpine plus cold, lesions of the collecting tubules and papillary ducts (ducts of Bellini) were found, in addition to hyperplasia of the interstitial tissue. These lesions were especially marked in the kidneys of rabbits which had twice undergone the action of pilocarpine + cold. No such lesions were seen in the kidneys of control rabbits.

AUTHORS: Chyžyński, Krysztof and Krzymiński, Albin

TITLE: A television signal generator

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika,
no. 12, 1962, 40, abstract 12-7-79 k (Pol. pat., cl.
21a1, 35/21, no. 44355, Oct. 10, 1961)

TEXT: The patent covers a generator of TV signals for the repair and tuning of television sets. The generator develops a complete TV signal of positive and negative polarity, an RF signal in the band 49 - 75 and 175 - 225 Mc/s modulated by vision and sound signals, and also voltages at frequencies of 100 c/s and 6.5 (5.5) Mc/s. For the picture one may use vertical or horizontal bars, or a lattice. Independent supply of vision and sound signals is possible. Features of the generator are the use of a ganged variable capacitor and an adjustable potentiometer divider allowing one to continuously vary the amplitude of the RF voltage, potentiometers for adjusting the voltage of the complete TV signal, quartz crystal

Card 1/2

A television signal generator

The bone marrow is collected from the medial side of the proximal end of the ulna. The hen is placed on its back. The needle with the mandrin is inserted between the flexor carpi ulnaris and pronator brevis muscles 1.5-2 cm. away from the ulnar process of the ulnar bone. Forceful pressure punctures the thin layer of compact bone tissue. The moment when the needle enters the bone marrow cavity is distinctly felt. After withdrawal of the mandrin and attachment of the syringe to the needle, the piston of the syringe is withdrawn until the first drop of bone marrow substance appears. The collected substance is deposited on a clean, degreased slide.
